32 Factor completely: $3y^2 - 12y - 28$

$3y^2 - 12y - 28 = (3y - 24)(y + 12)$

**Score 0:** The student made two factoring errors.
33 Thomas took a 140-mile bus trip to visit his grandparents. His trip is outlined on the graph below.

Explain what might have happened in the interval between $D$ and $E$.

He stopped for 30 min so probably got something to eat.

State the interval in which the bus traveled the fastest.

Between C and D

State how many miles per hour the bus was traveling during this interval.

60 mph

What was the average rate of speed, in miles per hour, for Thomas’s entire bus trip?

35 mph

Score 4: The student gave a complete and correct response.
Question 33

33 Thomas took a 140-mile bus trip to visit his grandparents. His trip is outlined on the graph below.

![Graph showing miles vs hours for the bus trip]

C to D:
\[
\frac{110 - 20}{25 - 1.5} = \frac{90}{1.5} = 60
\]

E to F:
\[
\frac{140 - 110}{4 - 3} = \frac{30}{1} = 30
\]

Explain what might have happened in the interval between D and E.

The bus stopped at a rest stop.

State the interval in which the bus traveled the fastest. C to D

State how many miles per hour the bus was traveling during this interval.

60

What was the average rate of speed, in miles per hour, for Thomas’s entire bus trip?

\[
\frac{270}{4}
\]

67.5 mph

Score 3: The student made an error in calculating the average rate of change for the entire trip.
Thomas took a 140-mile bus trip to visit his grandparents. His trip is outlined on the graph below.

Explain what might have happened in the interval between $D$ and $E$.

The bus stop in a gas station.

State the interval in which the bus traveled the fastest.

The fastest

State how many miles per hour the bus was traveling during this interval.

20 miles per hour

What was the average rate of speed, in miles per hour, for Thomas’s entire bus trip?

Thomas’ average of speed is $\text{[Response]}$.

Score 2: The student wrote two incorrect rates.
Question 33

33 Thomas took a 140-mile bus trip to visit his grandparents. His trip is outlined on the graph below.

Explain what might have happened in the interval between $D$ and $E$.

The bus may have took a stop.

State the interval in which the bus traveled the fastest. $\n$ $\n$

State how many miles per hour the bus was traveling during this interval.

$\frac{140}{1} = 140$ miles per hour.

What was the average rate of speed, in miles per hour, for Thomas’s entire bus trip?

Score 1: The student wrote a correct explanation only.
33 Thomas took a 140-mile bus trip to visit his grandparents. His trip is outlined on the graph below.

Explain what might have happened in the interval between D and E.

The bus was at a red light.

State the interval in which the bus traveled the fastest.

hours 1-2

State how many miles per hour the bus was traveling during this interval.

\[
\frac{110 - 20}{2 - 1} = 90 \text{ mph}
\]

What was the average rate of speed, in miles per hour, for Thomas’s entire bus trip?

\[
\frac{140}{20} = 7 \text{ mph}
\]

Score 0: The student did not show enough correct work to receive any credit.
Question 34

34 Graph $f(x)$ and $g(x)$ on the set of axes below.

\[ f(x) = x^2 - 4x + 3 \]

\[ g(x) = \frac{1}{2}x + 1 \]

Based on your graph, state one value of $x$ that satisfies $f(x) = g(x)$. Explain your reasoning.

\[ x = 0.5 \] This is a solution because at this $x$ coordinate the two graphs cross each other.

Score 4: The student gave a complete and correct response.
Based on your graph, state one value of x that satisfies \( f(x) = g(x) \). Explain your reasoning.

one solution is \((4, 3)\) because both \(f(x)\) and \(g(x)\) graph at that point and therefore intersect; any intersection is a solution to a system of equations.

Question 34

34 Graph \( f(x) \) and \( g(x) \) on the set of axes below.

\[
\begin{align*}
\text{f(x)} &= x^2 - 4x + 3 \\
\text{g(x)} &= \frac{1}{2}x + 1
\end{align*}
\]

Score 3: The student stated the coordinates of a point of intersection.
Question 34

34 Graph \( f(x) \) and \( g(x) \) on the set of axes below.

\[
\begin{align*}
f(x) &= x^2 - 4x + 3 \\
g(x) &= \frac{1}{2}x + 1
\end{align*}
\]

Based on your graph, state one value of \( x \) that satisfies \( f(x) = g(x) \). Explain your reasoning.

\((4,3)\) is a solution for \( f(x) = g(x) \) because that is the point where \( f(x) \) and \( g(x) \) meet on the coordinate plane.

Score 2: The student did not complete the graph of \( f(x) \) and stated the coordinates of a point of intersection.
34 Graph $f(x)$ and $g(x)$ on the set of axes below.

\[ f(x) = x^2 - 4x + 3 \]

\[ g(x) = \frac{1}{2}x + 1 \]

Based on your graph, state one value of $x$ that satisfies $f(x) = g(x)$. Explain your reasoning.

\[ \left( 4, 3 \right) \]

**Score 1:** The student graphed $g(x)$ correctly, but no further correct work was shown.
Graph $f(x)$ and $g(x)$ on the set of axes below.

$$f(x) = x^2 - 4x + 3$$

$$g(x) = \frac{1}{2}x + 1$$

Based on your graph, state one value of $x$ that satisfies $f(x) = g(x)$. Explain your reasoning.

One solution for $f(x) = g(x)$ is that the graphs cross. But they are not the same. $g(x)$ is a line, and $f(x)$ is a parabola.

Score 0: The student did not show enough correct work to receive any credit.
Question 35

35 A store sells grapes for $1.99 per pound, strawberries for $2.50 per pound, and pineapples for $2.99 each. Jonathan has $25 to buy fruit.

He plans to buy 2 more pounds of strawberries than grapes. He also plans to buy 2 pineapples.

If $x$ represents the number of pounds of grapes, write an inequality in one variable that models this scenario.

$$S = \text{Strawberries}$$

$$1.99x + 2.50(x+2) + 2.99(2) \leq 25$$

$$B = x + 2$$

Determine algebraically the maximum number of whole pounds of grapes he can buy.

$$1.99x + 2.50(x+2) + 2.99(2) \leq 25$$

$$1.99x + 2.50x + 5 + 5.98 \leq 25$$

$$4.49x + 10.98 \leq 25$$

$$-10.98$$

$$-10.98$$

$$\frac{4.49x}{4.49} \leq \frac{14.02}{4.49}$$

$$3 + 2 = 5$$

$$x \leq 3.12249$$

grapes = 3 pounds

Score 4: The student gave a complete and correct response.
Question 35

A store sells grapes for $1.99 per pound, strawberries for $2.50 per pound, and pineapples for $2.99 each. Jonathan has $25 to buy fruit.

He plans to buy 2 more pounds of strawberries than grapes. He also plans to buy 2 pineapples.

If $x$ represents the number of pounds of grapes, write an inequality in one variable that models this scenario.

\[
\frac{99x + 2.5x + 2(2.99)}{4.49} \leq 25
\]

Determine algebraically the maximum number of whole pounds of grapes he can buy.

\[
4.49x + 7.98 \leq 25
\]

\[
4.49x \leq 17.02
\]

\[
x \leq 3.790645882
\]

\[x \approx 3\]

3 lbs of grapes

Score 3: The student wrote an incorrect inequality, but solved it appropriately.
A store sells grapes for $1.99 per pound, strawberries for $2.50 per pound, and pineapples for $2.99 each. Jonathan has $25 to buy fruit.

He plans to buy 2 more pounds of strawberries than grapes. He also plans to buy 2 pineapples.

If \( x \) represents the number of pounds of grapes, write an inequality in one variable that models this scenario.

\[
25 \leq 5.98 + 1.99x + 2.50(x + 2)
\]

Determine algebraically the maximum number of whole pounds of grapes he can buy.

\[
\begin{align*}
-25 & \leq 5.98 + 1.99x + 2.50(x + 2) \\
-25 & \leq 5.98 + 1.99(3) + 2.50(5) \\
-25 & \leq 14.02 + 2.50x \\
14.02 & \leq 2.50x \\
3.12 & \leq x
\end{align*}
\]

Score 2: The student used the wrong inequality sign and did not find a number greater than 3.12.
Question 35

35 A store sells grapes for $1.99 per pound, strawberries for $2.50 per pound, and pineapples for $2.99 each. Jonathan has $25 to buy fruit. He plans to buy 2 more pounds of strawberries than grapes. He also plans to buy 2 pineapples.

If \(x\) represents the number of pounds of grapes, write an inequality in one variable that models this scenario.

\[
x = \text{grapes} \quad 2.99(2) + 2.60s + 1.99x \leq 25.00
\]

\[
p = \text{pineapples} \quad 2.99(2) + 2.60s + 1.99x \leq 25.00
\]

\[
s = \text{strawberries} \quad 2.99(2) + 2.60s + 1.99x \leq 25.00
\]

Determine algebraically the maximum number of whole pounds of grapes he can buy.

\[
2.99(2) + 2.60s + 1.99x \leq 25.00
\]

\[
6.98 + 2.60s + 1.99x \leq 25.00
\]

\[
-6.98 -6.98
\]

\[
2.60s + 1.99x \leq 18.02
\]

\[
2.60(2) + 1.99x \leq 19.02
\]

\[
5.00 + 1.99x \leq 19.02
\]

\[
-5.00 -5.00
\]

\[
1.99x \leq 14.02
\]

\[
1.99 \quad 1.99
\]

\[
7.04 \text{ pounds of grapes}
\]

Score 1:  The student wrote a correct inequality in more than one variable.
35 A store sells grapes for $1.99 per pound, strawberries for $2.50 per pound, and pineapples for $2.99 each. Jonathan has $25 to buy fruit.

He plans to buy 2 more pounds of strawberries than grapes. He also plans to buy 2 pineapples.

If $x$ represents the number of pounds of grapes, write an inequality in one variable that models this scenario.

\[(x) + (x + 2) + 5.98 \leq 25\]

Determine algebraically the maximum number of whole pounds of grapes he can buy.

Score 0: The student wrote an incorrect inequality, and no further correct work was shown.
36 Solve the system of inequalities graphically on the set of axes below. Label the solution set $S$.

Is the point $(-5,0)$ in the solution set? Explain your answer.

Yes, it is because it's in the shaded area of both inequalities and in the solution set.

Score 4: The student gave a complete and correct response.
Question 36

36 Solve the system of inequalities graphically on the set of axes below.
Label the solution set $S$.

\[
\begin{align*}
    y & : 3x < 5 \\
    1 & : \geq 2x - y
\end{align*}
\]

Is the point $(-5,0)$ in the solution set? Explain your answer.

Score 3: The student did not label the solution set $S$. 

Question 36

36 Solve the system of inequalities graphically on the set of axes below.
Label the solution set $S$.

Is the point $(-5,0)$ in the solution set? Explain your answer.

No because $(-5,0)$ is only a solution to $y + \frac{3}{2}x < 5$ and $x + 2 > x - y$.

Score 2: The student shaded $y + 3x < 5$ incorrectly and did not label the solution set $S$. 
Question 36

36 Solve the system of inequalities graphically on the set of axes below.

Label the solution set $S$.

\[
\begin{align*}
1 & \geq 2(-5) - 0 \\
1 & \geq -10 \\
1 & \geq 10 \\
-5 & \leq 0 \\
y & \leq 3x - 5 \\
y & \leq -15 \\
-15 & \leq 5
\end{align*}
\]

Is the point $(-5,0)$ in the solution set? Explain your answer.

\((-5,0)\) is in the solution set because it makes both inequalities true.

Score 1: The student wrote a correct explanation for the point $(-5,0)$, but no further correct work was shown.
36 Solve the system of inequalities graphically on the set of axes below.

Label the solution set $S$.

\[
\begin{align*}
y + 3x &< 5 \\
1 &\geq 2x - y
\end{align*}
\]

Is the point $(-5,0)$ in the solution set? Explain your answer.

**Score 0:** The student graphed $y + 3x = 5$ and $1 = 2x - y$ correctly, but neither line is labeled.
37 An ice cream shop sells small and large sundaes. One day, 30 small sundaes and 50 large sundaes were sold for $420. Another day, 15 small sundaes and 35 large sundaes were sold for $270. Sales tax is included in all prices.

If \( x \) is the cost of a small sundae and \( y \) is the cost of a large sundae, write a system of equations to represent this situation.

\[
\begin{align*}
30x + 50y &= 420 \\
15x + 35y &= 270
\end{align*}
\]

Let \( x \) = small sundae

Let \( y \) = large sundae

Peyton thinks that small sundaes cost $2.75 and large sundaes cost $6.75. Is Peyton correct? Justify your answer.

Peyton is wrong because if you plug these numbers in the first equation it will work but if you do it for the second one it will be wrong. It will be an extra 7.50 dollars in cost.

Using your equations, determine algebraically the cost of one small sundae and the cost of one large sundae.

\[
\begin{align*}
30x + 50y &= 420 \\
15x + 35y &= 270
\end{align*}
\]

\[
\begin{align*}
30x + 50y &= 420 \\
-30x - 70y &= -540
\end{align*}
\]

\[
\begin{align*}
30y &= 120 \\
y &= 4
\end{align*}
\]

Small sundae: 4

Large sundae: 6

Score 6: The student gave a complete and correct response.
Question 37

An ice cream shop sells small and large sundaes. One day, 30 small sundaes and 50 large sundaes were sold for $420. Another day, 15 small sundaes and 35 large sundaes were sold for $270. Sales tax is included in all prices.

If \( x \) is the cost of a small sundae and \( y \) is the cost of a large sundae, write a system of equations to represent this situation.

\[
\begin{align*}
x & = \frac{y}{3} & \text{of small sundaes} \\
y & = \frac{y}{5} & \text{of large sundaes} \\
30x + 50y &= 420 \\
15x + 35y &= 270
\end{align*}
\]

Peyton thinks that small sundaes cost $2.75 and large sundaes cost $6.75. Is Peyton correct? Justify your answer.

Using your equations, determine algebraically the cost of one small sundae and the cost of one large sundae.

\[
\begin{align*}
x &= 4 \\
y &= 6
\end{align*}
\]

Score 6: The student gave a complete and correct response.
Question 37

37 An ice cream shop sells small and large sundaes. One day, 30 small sundaes and 50 large sundaes were sold for $420. Another day, 15 small sundaes and 35 large sundaes were sold for $270. Sales tax is included in all prices.

If \( x \) is the cost of a small sundae and \( y \) is the cost of a large sundae, write a system of equations to represent this situation.

\[
\begin{align*}
30x + 50y &= 420 \\
15x + 35y &= 270
\end{align*}
\]

Peyton thinks that small sundaes cost $2.75 and large sundaes cost $6.75. Is Peyton correct? Justify your answer.

\[
\begin{align*}
30(2.75) + 50(6.75) &= 420 \quad \text{YES} \\
15(2.75) + 35(6.75) &\neq 270
\end{align*}
\]

Peyton is not correct. The numbers don’t work in the second equation.

Using your equations, determine algebraically the cost of one small sundae and the cost of one large sundae.

<table>
<thead>
<tr>
<th>( x )</th>
<th>( y )</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>16.6</td>

<tr>
<td>4</td>
<td>6.4286</td>
</tr>
<tr>
<td>5</td>
<td>5.714</td>
</tr>
</tbody>
</table>

\( x = 4 \)  
\( y = 6 \)

Score 5: The student used a method other than algebraic to find \( x = 4 \) and \( y = 6 \).
An ice cream shop sells small and large sundaes. One day, 30 small sundaes and 50 large sundaes were sold for $420. Another day, 15 small sundaes and 35 large sundaes were sold for $270. Sales tax is included in all prices.

If \( x \) is the cost of a small sundae and \( y \) is the cost of a large sundae, write a system of equations to represent this situation.

\[
\begin{align*}
30x + 50y &= 420 \\
15x + 35y &= 270
\end{align*}
\]

Peyton thinks that small sundaes cost $2.75 and large sundaes cost $6.75. Is Peyton correct? Justify your answer.

\[
\begin{align*}
30(2.75) + 50(6.75) &= 420 \checkmark \\
15(2.75) + 35(6.75) &\approx 270 \times
\end{align*}
\]

Peyton is not correct because although the prices worked for one day, it didn't for two.

Using your equations, determine algebraically the cost of one small sundae and the cost of one large sundae.

\[
\begin{align*}
30x + 50y &= 420 \\
15x + 35y &= 270
\end{align*}
\]

**Score 4:** The student wrote a correct system of equations and provided a correct justification.
An ice cream shop sells small and large sundaes. One day, 30 small sundaes and 50 large sundaes were sold for $420. Another day, 15 small sundaes and 35 large sundaes were sold for $270. Sales tax is included in all prices.

If $x$ is the cost of a small sundae and $y$ is the cost of a large sundae, write a system of equations to represent this situation.

\[
\begin{align*}
    x(30) + y(50) &= 420 \\
    x(15) + y(35) &= 270
\end{align*}
\]

Peyton thinks that small sundaes cost $2.75 and large sundaes cost $6.75. Is Peyton correct? Justify your answer.

\[
\begin{align*}
    2.75(30) &= 82.5 \\
    6.75(50) &= 337.5 \\
    \frac{337.5}{420} \approx 0.8125
\end{align*}
\]

\[
\begin{align*}
    2.75 \times 15 &= 41.25 \\
    6.75 \times 35 &= 236.25 \\
    \frac{236.25}{270} \approx 0.878
\end{align*}
\]

Using your equations, determine algebraically the cost of one small sundae and the cost of one large sundae.

- 2.75 small sundae cost
- 6.75 large sundae cost

Score 4: The student wrote a correct system of equations and provided a correct justification.
Question 37

37 An ice cream shop sells small and large sundaes. One day, 30 small sundaes and 50 large sundaes were sold for $420. Another day, 15 small sundaes and 35 large sundaes were sold for $270. Sales tax is included in all prices.

If \( x \) is the cost of a small sundae and \( y \) is the cost of a large sundae, write a system of equations to represent this situation.

\[
\begin{align*}
15(30x + 50y) &= 420 \\
30(15x + 35y) &= 270
\end{align*}
\]

Peyton thinks that small sundaes cost $2.75 and large sundaes cost $6.75. Is Peyton correct? Justify your answer.

\[
\begin{align*}
2.75 \times 30 + 6.75 \times 50 &= 97.5
\end{align*}
\]

Using your equations, determine algebraically the cost of one small sundae and the cost of one large sundae.

Score 3: The student wrote the system of equations in terms of \( S \) and \( L \), but solved it appropriately for \( x \) and \( y \).
37 An ice cream shop sells small and large sundaes. One day, 30 small sundaes and 50 large sundaes were sold for $420. Another day, 15 small sundaes and 35 large sundaes were sold for $270. Sales tax is included in all prices.

If \( x \) is the cost of a small sundae and \( y \) is the cost of a large sundae, write a system of equations to represent this situation.

\[
\begin{align*}
S + L &= 420 \\
S + L &= 270
\end{align*}
\]

Peyton thinks that small sundaes cost $2.75 and large sundaes cost $6.75. Is Peyton correct? Justify your answer.

\[
\begin{align*}
30(2.75) + 50(6.75) &= 420 \\
82.50 + 337.50 &= 420 \\
15(2.75) + 35(6.75) &= 270 \\
41.25 + 236.25 &= 277.50
\end{align*}
\]

No

Using your equations, determine algebraically the cost of one small sundae and the cost of one large sundae.

\[
\begin{align*}
S + L &= 420 \\
S + L &= 270 \\
2S + 2L &= 690 \\
S + L &= 345
\end{align*}
\]

Score 2: The student wrote a correct justification.
An ice cream shop sells small and large sundaes. One day, 30 small sundaes and 50 large sundaes were sold for $420. Another day, 15 small sundaes and 35 large sundaes were sold for $270. Sales tax is included in all prices.

If \( x \) is the cost of a small sundae and \( y \) is the cost of a large sundae, write a system of equations to represent this situation.

\[
\begin{align*}
\text{Day 1:} & \\
\text{30x} + 50y &= 420 \\
\text{Day 2:} & \\
15x + 35y &= 270
\end{align*}
\]

Peyton thinks that small sundaes cost $2.75 and large sundaes cost $6.75. Is Peyton correct? Justify your answer.

Using your equations, determine algebraically the cost of one small sundae and the cost of one large sundae.

**Score 1:** The student wrote one correct equation, but no further correct work was shown.
37 An ice cream shop sells small and large sundaes. One day, 30 small sundaes and 50 large sundaes were sold for $420. Another day, 15 small sundaes and 35 large sundaes were sold for $270. Sales tax is included in all prices.

If $x$ is the cost of a small sundae and $y$ is the cost of a large sundae, write a system of equations to represent this situation.

\[
\begin{align*}
\lambda &= 30x + 50 = 420 \\
y &= 15x + 35 = 270
\end{align*}
\]

Peyton thinks that small sundaes cost $2.75 and large sundaes cost $6.75. Is Peyton correct? Justify your answer.

Yes because the small sundaes are the right amount and the large should cost more.

Using your equations, determine algebraically the cost of one small sundae and the cost of one large sundae.

\[
\begin{align*}
y &= 30x + 50 = 420 \\
\quad &\quad - 50 = -50 \\
\quad \frac{30x}{30} &= \frac{370}{30} \\
\lambda &= 12.30 \\
\end{align*}
\]

\[
\begin{align*}
y &= 15x + 35 = 270 \\
\quad &\quad - 35 = -35 \\
\quad \frac{15x}{15} &= \frac{235}{15} \\
\gamma &= 15.70 \\
\end{align*}
\]

Score 0: The student did not show enough correct work to receive any credit.
